## urban design planning

### Project overview

Two parts of plots, plot **1002/2**, size 13,415 m<sup>2</sup> and plot **1053/2**, size 434 m<sup>2</sup>, are located in Vokovice area, Prague 6. Vokovice, part of Prague 6 will remain attractive location for residential building developing. This area is very well connected to the Prague city center by Prague's public transport (all main tram lines, busses and further metro which are on the walking distance from location very well connect this area with Prague city center). In addition, Prague International Airport is also very close to the location which further makes this area attractive and convenient for frequent travelers and modern business orientated people.

In the middle of the last century this area was well known for greenhouses and largely used for gardening. However, although suitable for planting this area by time became largely neglected. For this reason, primarily project objective was to revitalize this area and connect it further with surrounding residential district granted with all public services such as schools, kindergartens, hospitals etc.

- A preliminary design as well as technical solution of the new station was agreed in **12/2008** whereas the final appearance will be finalized in a relevant stage of the planning process.
- All changes of the Master plan with special priority have been presented in public by Prague City for possible comments during 10-11/2008 and again corrected by an actual Master plan during **01/2009**.
- The EIA ("Environmental Impact Assessment") for modernization of Railway track was approved in the **beginning of 2009**. Planning engineers of Czech Railways finalizing project documentation for the zoning permit so the zoning process for the Railway modernization can started.

## CONTENTS AND ARCHITECTURAL FORM

**Basic concept** during construction of „Bulbuderska terasa“ is following the existing structure dimensions on the location, which we literally get by multiplying colors, forms and structure of already existing urban inheritance. The assignment was to fit and decompose entire structure in front anterior plane which vertically, horizontally and profundity lay on different levels.

Existing structures have small dimensions by regulation (4 – 8 m), so the basic concept was to repeat such distance on front anterior, and try visual braking the structure to smaller parts. Like that, by building one big business – residential structure the ambient change has been avoided, and this kind of project with its visual structure has fit to existing ambient.

In line with promoting since this concept celebrates one of the biggest 20th century inventions which is alternating current. Alternating current made possible the movement of electric charge in reverse directions (+,-).

This helped electric power, audio and radio signals to be delivered and carried on electrical wires. This tremendous invention deeply shaped and changed human civilizations. In addition, this concept should also celebrate inventor Nikola Tesla. Serbian origin, Nikola Tesla was men of the future which he created using extraordinary capacity for imagination. Without Nikola Tesla and his work on alternating current we would not live in the same world today.
